

Planting Procedure- Biodegradeable Pots (inc. own roots)

All information contained in this article is meant as a guide only, and variances may occur under different site conditions.

Timing of Planting

Generally potted vines will not be available for planting until late October. Planting should occur preferably on cool days and ideally prior to the hot and dry part of the season. Vines should be planted as soon as possible once received. Potting mix dries out at a rapid rate. If the potted vines can not be planted immediately, store them in an area protected from the wind, and water as necessary.

Planting

Prepare a planting hole approximately 15cm wide by 30 cm deep. **Gently place** the potted vine in the planting hole and backfill with topsoil. The top of the pot needs to be covered with approximately 5cm of soil to prevent rapid evaporation of moisture from the potting mix from which the vine initially depends. Shovel some topsoil around the base of the vine and press firmly on the soil to expel all air pockets.

We strongly recommend the use of vine guards with biodegradable pots to buffer them from high UV, wind and vermin.
